

WORKING PROTOTYPE / PROJECT PITCH

RAISE / FOUNDRY GAMES 2026

CS

CIVISCOPE

Damage Mapper

From damage detection to human response.

AI-assisted reporting, explainable priority and multi-department coordination.

An incident report should lead to action.

Citizens, coordinators and responders need the same incident context.

01

Citizen uncertainty

What happened? Where exactly? What assistance is needed?

02

Coordination load

Which report is urgent? Is it a duplicate? Which teams should receive it?

03

Response visibility

Has the team acknowledged? What was done? Who verifies completion?

One report. A connected response workflow.

The same incident connects citizen reporting, department action and admin verification.

05

VERIFY

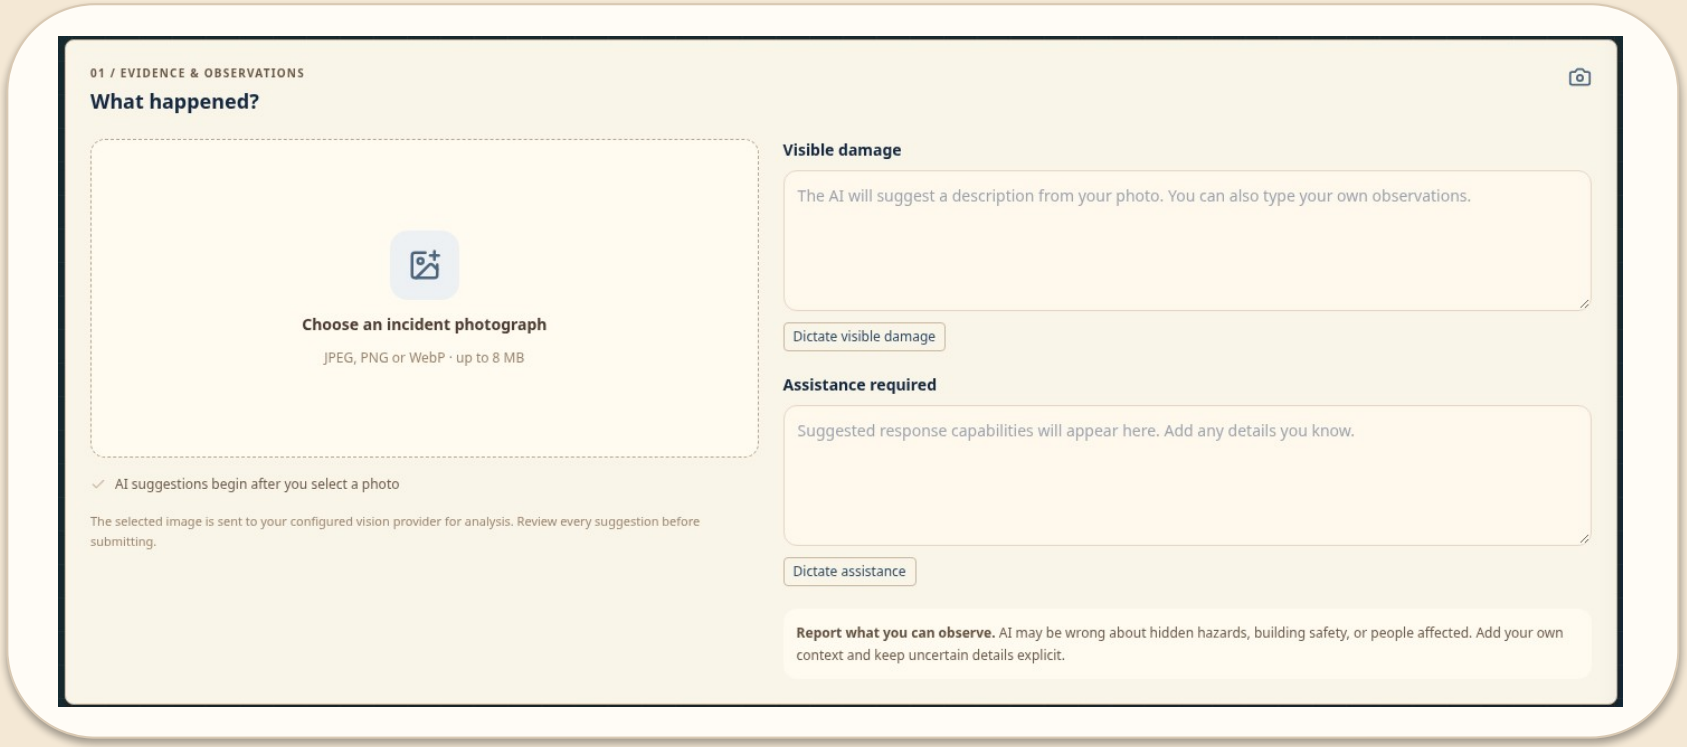

Field updates + photos

Admin work review

Citizen tracks the report • Responders see their department’s assignments • Admin reviews exceptions

Report the damage. Confirm the exact place.

Actual prototype screens · simulated local data

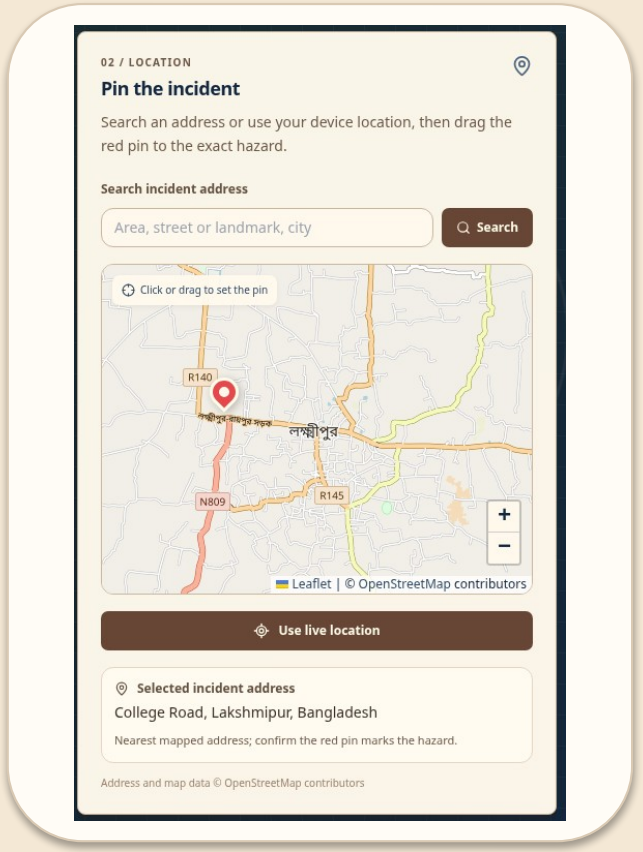

Photo + editable observations

JPEG, PNG or WebP · up to 8 MB

AI assists the report. The user stays in control.

Uses a configured Gemini vision model through Google AI Studio.

INPUT

Selected photo

The uploaded incident image and the reporter’s observations.

OUTPUT

Structured suggestions

Visible damage, assistance, category, severity, hazards and uncertainty.

CONTROL

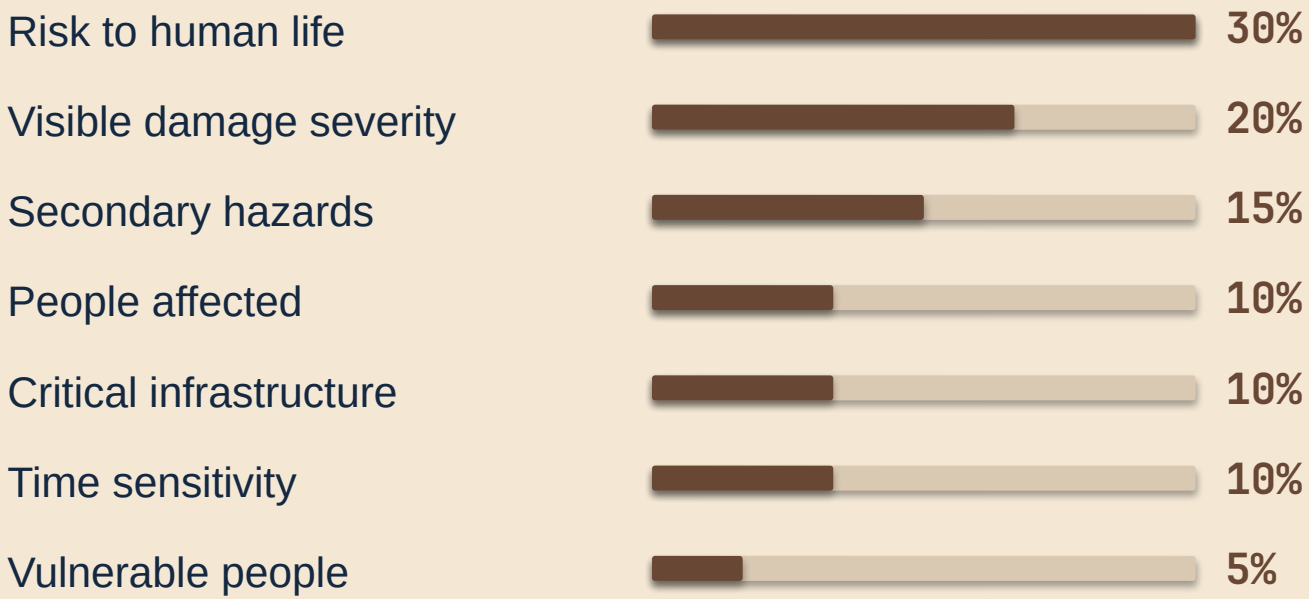

Editable + reviewable

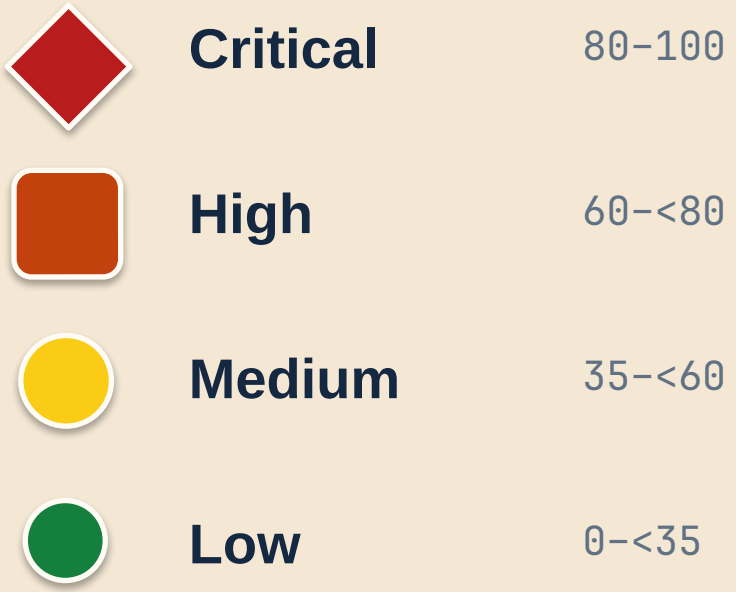

Validate the response; keep human edits; route uncertain evidence for review.

If vision is unavailable, clear typed hazards can still reach professional teams.

Priority you can explain—and see on the map.

A deterministic weighted score from 0 to 100; AI observations are inputs, not the final score.

Unknown information is flagged for review.

Persistent labels • different sizes and shapes
Score on the pin • keyboard selection

The right department receives the incident.

Professional assignments can proceed while evidence review remains pending.

Building fire	→	Fire & Emergency Services + Medical
Sparking / fallen power line	→	Electricity Distribution Utility (DISCOM)
Blocked road / fallen tree	→	Municipal / Panchayat & Public Works
Medical emergency	→	Health Department & Emergency Medical Services

Admin handles ambiguous reports, likely duplicates, public/news sources, restricted specialists and routing exceptions.

Nearby reports are not always the same incident.

Combine location, hazard category and text similarity; keep confirmation with the admin.

150 m

Candidate search radius

Haversine distance + hazard category
+ textual similarity

Same flooded road

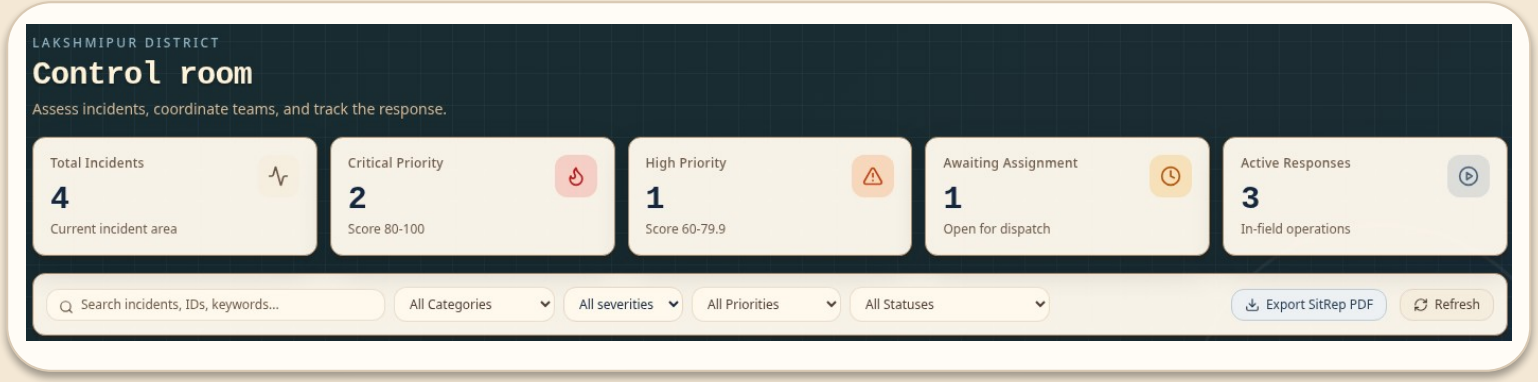

Similar nearby reports can be reviewed and attached to one incident.

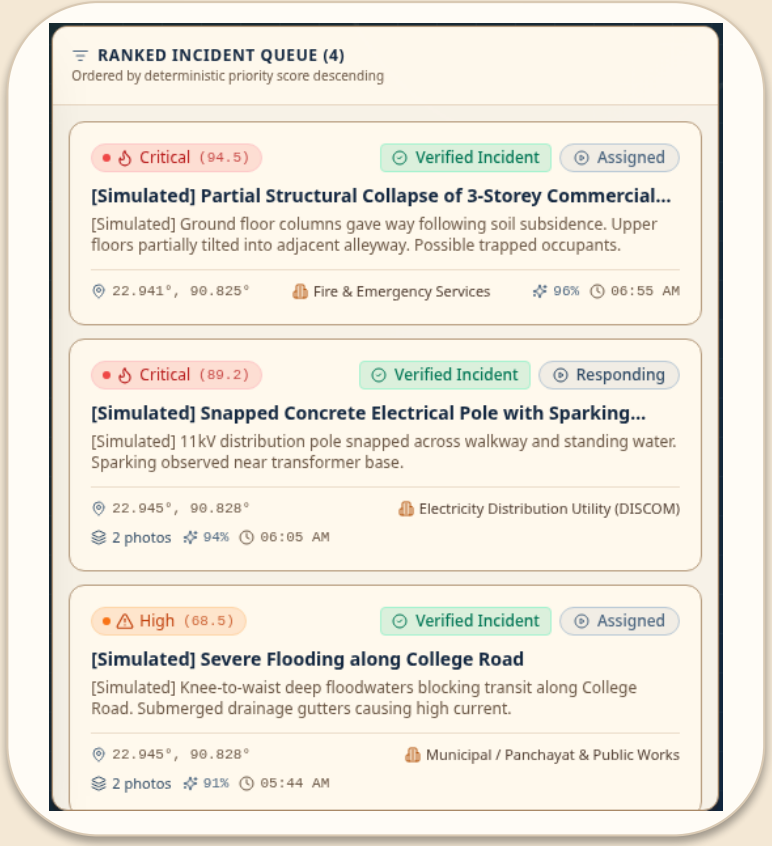

A power line beside floodwater

A different hazard can remain distinct, even when the reports are close.

The control room sees a ranked operational picture.

Actual prototype screens · simulated local data

Map + ranked incident queue

Filter incidents, inspect priority rationale, review exceptions, verify response work and export a SitRep PDF.

Assigned is not the same as completed.

Each department manages its own assignment on a shared incident.

01

ACKNOWLEDGE

Accept the assigned task

02

UPDATE

En route → on site → in progress

03

EVIDENCE

Field notes + uploaded photos

04

REVIEW

Admin verifies or requests rework

Independent team statuses + completion notes + audit history

Incident closure requires the applicable routing and work-verification checks.

India-focused teams, with clear activation boundaries.

11 configured application categories: 10 response teams and the DEOC coordination role.

PROFESSIONAL RESPONSE

Fire & Emergency Services

Electricity Distribution Utility (DISCOM)
Municipal / Panchayat & Public Works
Health & Emergency Medical Services
Police & Traffic Control

RESTRICTED SPECIALISTS

State Disaster Response Force (SDRF)
National Disaster Response Force (NDRF)
Admin activation required

RELIEF SUPPORT

Civil Defence & Home Guards

NGO / Humanitarian Relief Partners

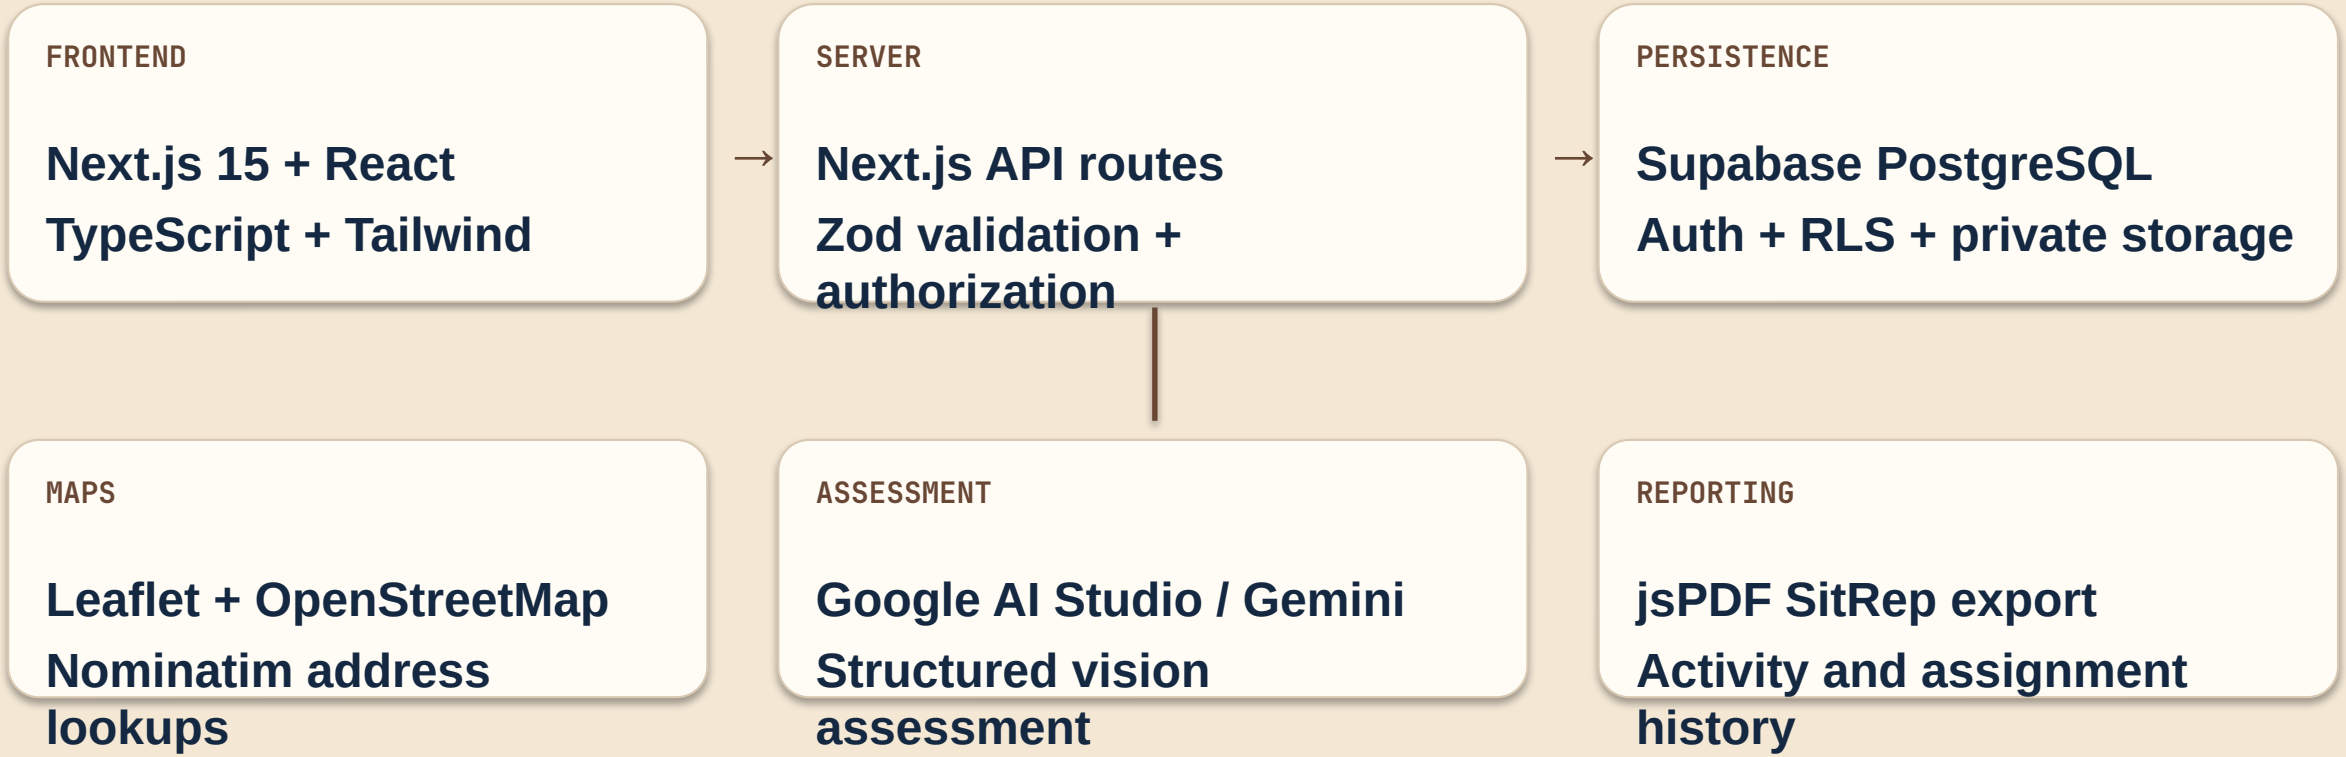

Community Volunteers / Aapda Mitra

Support in safe relief operations

DEOC coordinates. Department categories do not imply real agency enrollment or government integration.

Built as an integrated web application.

Browser interface → authenticated API → database, private evidence storage and external services.

Server-owned identity • department-scoped access • private image validation • transactional report delivery

Tested beyond the happy path.

Results from the latest completed local verification—not field performance measurements.

44

Browser tests passed

26

HTTP API methods checked

112

API assertions passed

CHECKED EDGE CASES

Wrong role / department • invalid uploads • failed address lookup
AI unavailable • delayed AI reply • duplicate reports • rework
GPS refusal • invalid coordinates • keyboard use • map tile failure

Show the handoff—not just the dashboard.

A short walkthrough using the isolated fictional demo accounts.

1	CITIZEN	Upload a photo, review suggestions, confirm the pin and submit a clear building-fire report.
2	FIRE PORTAL	Open the Fire account; show the related incident arriving without manual admin assignment.
3	RESPONDER	Acknowledge the task, update progress, attach field evidence and submit completion notes.
4	ADMIN	Review the work; verify or request rework. Show priority rationale, activity history and SitRep export.

Demo data is temporary. If vision is unavailable, demonstrate the explicit-hazard routing fallback.

A working prototype, with a clear deployment boundary.

Implemented functionality is distinct from a verified operational deployment.

IMPLEMENTED + LOCALLY TESTED

Connected application

Reporting, vision integration, priority scoring, routing, scoped response workflows, private evidence and PDF export.

REQUIRED BEFORE HOSTED USE

Complete setup + acceptance

Apply unapplied Supabase migrations, configure the production origin and geocoding provider, then test authenticated hosted workflows.

Internet and browser location permissions are needed. Offline synchronization and real agency dispatch are not implemented.

From a citizen’s report to a verified response.

Make the incident visible.
Make priority explainable.
Make the handoff traceable.

REPORT → MAP → PRIORITIZE → RESPOND → VERIFY
